Telstra Health Smart API+

Revolutionising primary care integration with FHIR®-based technology

Built on FHIR®, Telstra Health Smart API+ supports seamless partner integrations and practice access to data and data exchange across Telstra Health's primary care software solutions and the primary care ecosystem.

Key features:

More streamlined experience for partner integrators:

Partner integrators are all too familiar with the existing challenges of bespoke integrations across different health platforms. Smart API+ will help address these challenges by standardising the language of data exchange and, when coupled with the flexibility and uniformity of the Smartbar for the user interface experience, will pave the way for a future of single-build integrations that are independent of release cycles and technologies of underlying platforms so that new capability can be deployed and modified efficiently.

Secure and seamless data access:

Leveraging FHIR® and API technology, practices and integrators will find data exchange more secure and standardised. Existing practices of data exchange using agents and SQL queries that open entire practice databases to third parties creates risk. Smart API+ offers seamless, secure access points that ensure only certain information is accessed for particular purposes through a system that provides control and the ability to monitor data access.

Enhanced user experience of partner capability:

When coupled with Telstra Health's Smart Connected Care capability, clinicians and managers will be able to access integrated web-based partner applications regardless of whether their patient management system is in the cloud or on-premise. Partner applications using Smart API+ and Smart Connected Care will provide an intuitive in-platform experience without requiring multiple logins, ensuring users can access and use new technology easily and securely.

Get started now

Telstra Health Smart API+ is now available for partners integrating with MedicalDirector Helix, Telstra Health's cloud-based general practice patient management software and on a case-by-case basis for integrations with MedicalDirector Clinical. Helix customers can use Smart API+ to access their practice data and incorporate their bespoke technologies, fostering greater customisation and innovative care models.

Join the ecosystem

Technology partners focused on enhancing healthcare and practice efficiencies can express interest in collaboration here.

Explore Telstra Health's existing ecosystem of partners and join us in accelerating the adoption of digital health solutions.

Partnering to accelerate the adoption of digital health and connected care

Telstra Health is committed to accelerating the adoption of digital health solutions that lead to real improvements across the Australian health and aged care systems through its partnership with Australia's national science agency CSIRO and involvement with the Australian FHIR® accelerator program Sparked.

Telstra Health's partnership with Smile Digital Health will bring Smile's HL7® FHIR® first Health Data Platform solution and integration platform to Australia and New Zealand. Smile Digital Health technology underpins Telstra Health's Health Information Exchange to facilitate the exchange of patient information across different healthcare organisations and systems for large customers or geographic regions, with potential for commonwealth, state or territory governments, large private hospital groups or private health insurers.
